

- 1) Make sure dependencies are installed - pytorch, zmq (<https://zeromq.org/download/>)
- 2) Run client – Clients need to be run before server, otherwise error will be given
 - cd Client_0
 - python client.py in a terminal
 - cd to all client folders Client_1 etc.. on different terminals and run In same manner
- 3) Run server code
 - Hyper parameters and other params are given through the file parameters.txt provided in Server folder
 - Change parameters as needed.
 - Run python server.py in a terminal (make sure all clients are running before this step)
- 4) Adding more clients
 - if more clients needed to be created than the three clients provided, copy all codes in client folder to a new folder
 - Change port number in client.py copied to the next sequence in the port number
eg: socker.bind("tcp://*:5556"). New assigned port should be 5558 for fourth client.
So it should be changed to socker.bind("tcp://*:5558") in new client.py file
